

FULL STACK DEVELOPMENT INTERNSHIP

TASK DETAILS & EVALUATION GUIDE

1 MONTH INTERNSHIP PROGRAM

"Build. Innovate. Impact."

INNOVATION HACKS

<https://innovationhacks.in>

01 Internship Overview

Innovation Hacks is running a one-month, project-based Full Stack Development Internship designed to mirror how real product teams build software — from interface to infrastructure. Instead of isolated assignments, interns progress through a single connected build: a modern frontend, a REST API backend, a persistent database layer, and a final AI-powered full-stack application, deployed and demonstrated end-to-end.

This guide is the single source of truth for the internship. It defines every task, the technologies you may use, what you must submit, and exactly how your work will be evaluated.

02 Internship Objective

By the end of this internship, you will be able to:

- Design and build responsive, production-style frontend interfaces using modern frameworks.
- Architect and implement REST APIs with proper validation, error handling, and status codes.
- Model and integrate real databases with secure, well-structured CRUD operations.
- Ship a complete, deployed full-stack application with at least one AI-powered feature.
- Work with the same tools professional engineering teams use daily — Git, GitHub, environment configuration, and deployment platforms.

FULL-STACK ARCHITECTURE FLOW

Frontend	REST API	Backend	Database	Cloud
----------	----------	---------	----------	-------

03 Task 1 — Modern Frontend Development

TASK 1

Developer Productivity Dashboard

OBJECTIVE

Build a responsive Developer Productivity Dashboard using React.js or Next.js that reflects real product-UI standards — clean structure, sensible states, and a component architecture that could plausibly ship.

REQUIREMENTS

- Dashboard / home page as the primary landing view
- Navigation bar with clear, accessible wayfinding
- User / profile section
- Project and task cards with a consistent visual system
- Progress indicators for tasks and projects
- Search and filter functionality
- Fully responsive design across mobile, tablet, and desktop
- Loading and empty states for all dynamic views
- Clean, reusable component architecture

RECOMMENDED TECHNOLOGIES

React.js • Next.js • HTML5 • CSS3 / Tailwind CSS • JavaScript / TypeScript

DELIVERABLES

- GitHub repository with complete frontend source code
- Demo video walking through the dashboard
- LinkedIn post showcasing the completed task

EVALUATION NOTES

Evaluated on responsiveness, component structure, state handling (loading / empty / error), and visual consistency — not just visual polish.

04 Task 2 — Backend & REST API Development

TASK 2

Users, Projects & Tasks API

OBJECTIVE

Design and build a REST API that powers user, project, and task data — the backend that Task 1's dashboard and Task 4's platform will ultimately depend on.

REQUIREMENTS

- User management endpoints
- Project creation and retrieval
- Task creation, update, and deletion
- Task status management (e.g. todo / in-progress / done)
- Centralized error handling
- Input validation on all write operations
- Correct, meaningful HTTP status codes
- Environment variables for configuration and secrets
- Clear API documentation (README or OpenAPI/Postman collection)

RECOMMENDED TECHNOLOGIES

Node.js + Express • **Python + FastAPI** • **Python + Flask**

DELIVERABLES

- GitHub repository with complete backend source code
- API documentation
- Demo video walking through key endpoints
- LinkedIn post showcasing the completed task

EVALUATION NOTES

Evaluated on API design consistency, validation and error handling, status-code correctness, and documentation clarity.

05 Task 3 — Database Integration

TASK 3

Persistent Data Layer

OBJECTIVE

Integrate a real database into the Task 2 API so user, project, and task data persist reliably, with relationships modeled correctly and configuration handled securely.

REQUIREMENTS

- User data storage
- Project data storage
- Task data storage
- Full CRUD operations across all entities
- Data validation at the database / schema level
- Relationships or references between users, projects, and tasks where applicable
- Secure database configuration — no hard-coded credentials

ARCHITECTURE VISUALIZATION

- Frontend → REST API → Backend → Database

RECOMMENDED TECHNOLOGIES

MongoDB • **MySQL** • **PostgreSQL**

DELIVERABLES

- GitHub repository with database schema / models included
- Demo video showing live CRUD operations
- LinkedIn post showcasing the completed task

EVALUATION NOTES

Evaluated on schema design, correctness of relationships, validation, and secure handling of configuration.

06 Task 4 — Final Full-Stack Application

TASK 4

AI-Powered Project & Task Management Platform

OBJECTIVE

Bring everything together into a single, deployed application: an AI-powered project and task management platform that combines the frontend, API, backend, and database built across Tasks 1–3.

REQUIREMENTS

- Registration, login, logout, and protected routes (Authentication)
- Project overview, task statistics, progress tracking, and recent activity (Dashboard)
- Create, edit, delete, and view project details (Project Management)
- Create, assign, update status, set priority and due dates, search and filter (Task Management)
- At least one AI-powered capability integrated into the product experience

AI FEATURE — IMPLEMENT AT LEAST ONE

- AI-assisted task generation
- Task summarization
- AI-generated project descriptions
- AI productivity suggestions
- AI-assisted task prioritization

RECOMMENDED DEPLOYMENT PLATFORMS

- Vercel
- Netlify
- Render
- Railway
- or another suitable platform

RECOMMENDED TECHNOLOGIES

React.js / Next.js • Node.js / FastAPI / Flask • MongoDB / MySQL / PostgreSQL • Vercel / Netlify / Render / Railway

DELIVERABLES

- GitHub repository — MANDATORY
- Demo video link — MANDATORY
- Live deployment link — OPTIONAL
- LinkedIn post with Innovation Hacks tagged — MANDATORY

EVALUATION NOTES

Evaluated as the capstone deliverable — functionality, integration across all layers, AI feature quality, and production-readiness all carry the most weight here.

07 Final Submission Requirements

Every task (1 through 4) requires the following four submission items:

- ☐ GitHub Repository Link *Mandatory*
- ☐ Demo Video Link *Mandatory*
- ☐ Live Deployment Link *Optional*
- ☐ LinkedIn Post Link — with Innovation Hacks tagged *Mandatory*

LinkedIn Requirement

For every task you publish:

- Publish the completed project or task on LinkedIn
- Tag the official Innovation Hacks LinkedIn page
- Submit the LinkedIn post URL with your task submission

08 GitHub Requirements

Every repository you submit should contain:

- README.md
- Complete source code
- Installation instructions
- Technology stack used
- Feature list
- Screenshots
- Environment variable instructions (.env.example, not real values)
- Demo link

IMPORTANT — Never upload API keys, passwords, database credentials, or any other secrets to a public repository.

09 Demo Video Requirements

RECOMMENDED DURATION

2 – 5 minutes

DEMONSTRATE

- The application running end-to-end
- Main features in action
- Key technical implementation details
- The final result

10 Evaluation Criteria

Every task and the final platform are scored against the same rubric:

Evaluation Criteria	Weight
Functionality	25%
Code Quality	20%
UI / UX	15%
Technical Implementation	15%
Documentation	10%
GitHub Repository Quality	5%
Demo & Presentation	5%
Innovation / Additional Features	5%
Total	100%

11 Performance-Based Reward

TOP 3 PERFORMERS

₹12,000 – ₹15,000

Performance-based stipend, awarded based on overall internship performance.

EVALUATION MAY CONSIDER

- Quality of all four tasks
- Technical implementation
- Innovation
- Code quality
- GitHub activity
- Documentation
- Timely submission
- Demo quality
- Problem-solving
- Professionalism

12 Important Guidelines

- Complete tasks within assigned deadlines.
- Do not directly copy projects from tutorials or repositories.
- AI tools may be used as learning / development assistants, but interns must understand their implementation.
- Maintain organized GitHub repositories.
- Never expose credentials or API keys.
- Submit functional projects.
- Maintain professional communication.
- Late submissions may affect evaluation.
- Plagiarism may result in disqualification.
